SOFT RELAX-R + RECYCLING RACK
Automatic washing machine with water recirculation system

The unit consists of an automatic rotary drum washing machine placed on a special cabinet structured to separate the debris incorporated in the waste water generated by cleaning.
After filling the tank with 50 liters of water, it is only necessary to connect the appliance to the electrical network. When the water is used up, it must be sent to the specific collection center.

SOFT RELAX-R

Automatic drum washing group with electronic control and management. Regulation of time and pressure

FIRST DRAWER

With coarse collection basket. Filtration with non-woven fabric

SECOND DRAWER

Fine filtration with fabrics from 400 to 50 microns

BASKETS

For easy removal of the support material dissolved in water

TANK WITH SUBMERSIBLE PUMP

It allows the collection of washing water and its re-launch to the high-pressure pump.

The basket can contain about 12/15 pieces with a maximum size of 20x30x80 mm.
Considering 15 pieces per cycle and that the washed models have a volume ratio between the printing material and the support material of about 4:1, the water in the tank will need to be replaced after 60/80 washes.
The variables that intervene in the washing cycle are the following:
pressure, time, temperature, diameter of the spheres used, shape of the piece, thickness of the model structure, type of material used for the model, type of support.
